The American Psychiatric Association Publishing Textbook of Psychosomatic Medicine and Consultation-Liaison Psychiatry, Third Edition

Edited by **James L. Levenson, M.D.**

As with the first two editions, this third edition of *The American Psychiatric Association Publishing Textbook of Psychosomatic Medicine and Consultation-Liaison Psychiatry* is the most comprehensive reference on the subspecialty available. Extensively revised and updated, this new edition also includes four chapters that are newly authored.

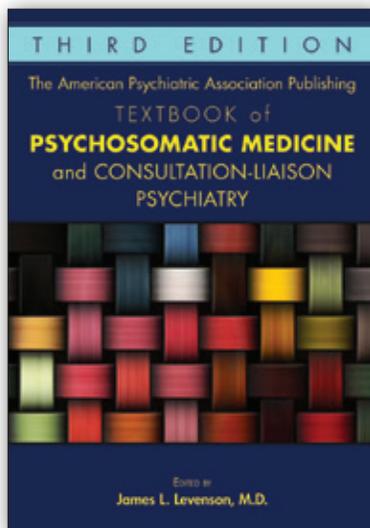

The emphasis on a diversity of perspectives remains as strong as ever: Chapter authors represent a range of backgrounds and disciplines, and of opinions and viewpoints, and 24 of the 88 contributors are from countries other than the United States.

Organized into four sections, the textbook addresses

- General principles of evaluation and management, legal and ethical issues, and psychological reactions to illness.
- Psychiatric symptoms and disorders—including dementia, depression, anxiety, eating and sleep disorders, and sexual dysfunction—commonly encountered in medically ill populations.
- Psychological and social aspects of diseases and disorders affecting the various organ systems.
- Psychiatric interventions in the medically ill, including psychopharmacology, psychotherapy, electroconvulsive and other neurostimulation therapies, and palliative care.

Encyclopedic in its scope and accessible in its presentation, *The American Psychiatric Association Publishing Textbook of Psychosomatic Medicine and Consultation-Liaison Psychiatry* is an essential resource for psychiatry residents, psychosomatic medicine fellows, attending psychiatrists, and other specialists who need to stay up to date with the rapidly expanding evidence base in the field.

Handbook of Medicine in Psychiatry, Second Edition

Edited by Peter Manu, M.D., and Corey Karlin-Zysman, M.D.

For the second edition, the text has been thoroughly updated and offers expanded coverage of life-threatening adverse reactions to psychotropic drugs, metabolic emergencies, and risk assessment for medical deterioration in psychiatric settings. This information is of critical importance, as at least 50% of psychiatric patients have significant medical disorders that contribute to their poor quality of life and decreased life span. Indeed, clinical medical experience obtained during psychiatric residency may seem distant to psychiatrists confronted with seriously ill patients.
